

Finals Task 2.
Working and Navigating through Power BI

Instruction: This task will allow you to navigate and put together the Power Bi workflow from Data Preparation, Modeling, Analysis and Visualization.

Part 1. Data Acquisition. Download the airlines_data.csv for the dataset that you need to work on, your task is to clean and prepare the data ready for modeling. The dataset is currently in a form of flat csv file; you are to check and correct necessary data cleaning task.

Part 2. Data Model – Design the data model – using Star Schema

Part 3. Do the necessary Measures and Calculated Columns use DAX and organized your measures into folders (by going to the Model view-Click Data) then under properties – add a folder named measures and put all measures in the folder

Here are the measures:

- **Total Flights** = COUNTROWS(flights)
- **% Canceled** = DIVIDE([Canceled Flights],[Total Flights],"-")
- **% Delayed** = DIVIDE([Delayed Flights],[Total Flights],"-")
- **% On-Time** = DIVIDE([On-Time Flights],[Total Flights],"-")
- **Canceled Flights** = CALCULATE([Total Flights],flights[CANCELLED]=1)
- **Delayed Flights** = CALCULATE([Total Flights],flights[DELAYED]=1)
- **On-Time Flights** = CALCULATE([Total Flights],flights[STATUS]="On-Time")

Calculated Columns:

- STATUS = IF(flights[CANCELLED]=1,"Canceled",
IF(flights[DEPARTURE_DELAY]>0,"Delayed", "On-Time"))

Include the ff: measures as well and construct the appropriate formula

1. Total Diverted Flights
2. Total On-Time
3. Average Delays for Airline Company

Part 4. Do the necessary visuals for all the measures computed

Output
